

ABSTRACT OF THE DISCLOSURE

An apparatus and method for assembling a soft tissue reconstruction system having first and second anchor assemblies. The apparatus includes a base plate, a first mounting block mounted to the base plate and having a first reference surface against which the first anchor assembly is mountable, a second mounting block slidably mounted to the base plate and having a second reference surface against which a bone anchor of the second anchor assembly is mountable, a measurement bar extending from the second mounting block and slidable relative to the first mounting block, a support block slidably mounted to the measurement bar having a third reference surface for abutting against a tissue presentation surface of the second anchor assembly, and a tensioning device for tensioning a graft attached to the first anchor assembly. Indicia on the measurement bar indicate the proper locations of the reference surfaces and components mounted/abutted thereto.
